AI Builder Cup

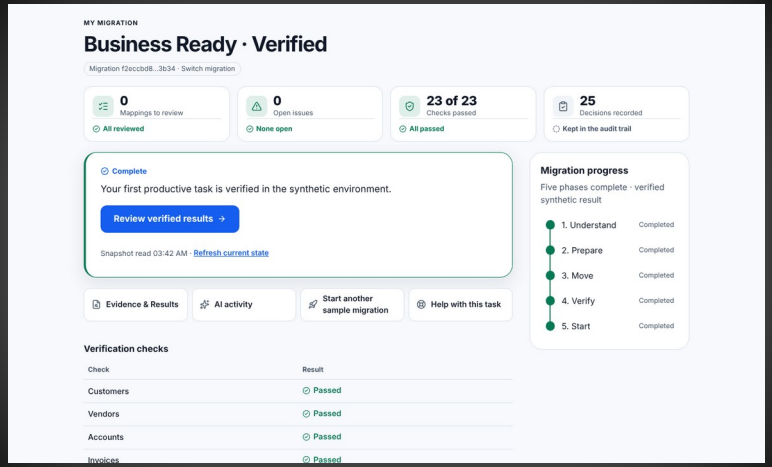

Build in JAPAC.
Build for the world.

Team Details: MoveBooks AI
Team name: MoveBooks AI

a. Team lead: Jincen E Mathew
b. Team member: Kunal Nangia
c. Contact: Pending owner input

Problem: BFSI: Intelligent Risk, Fraud & Financial Experiences

Bounded synthetic Beta.

Explore Demo, My Migration, Play and local test-package validation.

Humans approve. Deterministic tools verify.

Bounded live Gemini test passed; the public Beta stays deterministic.

Brief about the idea

MoveBooks AI

Move your books. Keep your confidence.

Help accountants understand readiness, make informed mapping decisions and verify the first productive task after a migration.

Play teaches concepts. Explore Demo rehearses Harbor Light Books. Try Your Data validates permitted test CSV/JSON packages locally.

Current boundary: synthetic information, synthetic target and approved first invoice. No real provider migration.

Opportunities

Financial handover risk: an import can finish while mappings, configuration or the first working task remain unresolved.

Proposed differentiation: one governed path from learning and readiness to approved decisions, reconciliation and verified productive use.

How it works: deterministic agents run the workflow; a gated Gemini Advisor explains and an independent Reviewer challenges. Humans retain financial authority.

USP hypothesis: coherent, evidence-backed migration confidence. No competitor-superiority or measured impact claim.

List of features offered by the solution

Play and My Migration: a learning mission; returning users resume or switch migrations from an owner-scoped list.

Explore Demo: discovery, readiness, versioned plan, account 1200 mapping, human decisions and synthetic migration.

Try Your Data: local validation, actionable errors, replacement/revalidation and explicit review. Hosted handoff remains gated.

Reasoning and review: user-requested bounded advisor, independent challenge and clearly labeled deterministic fallback.

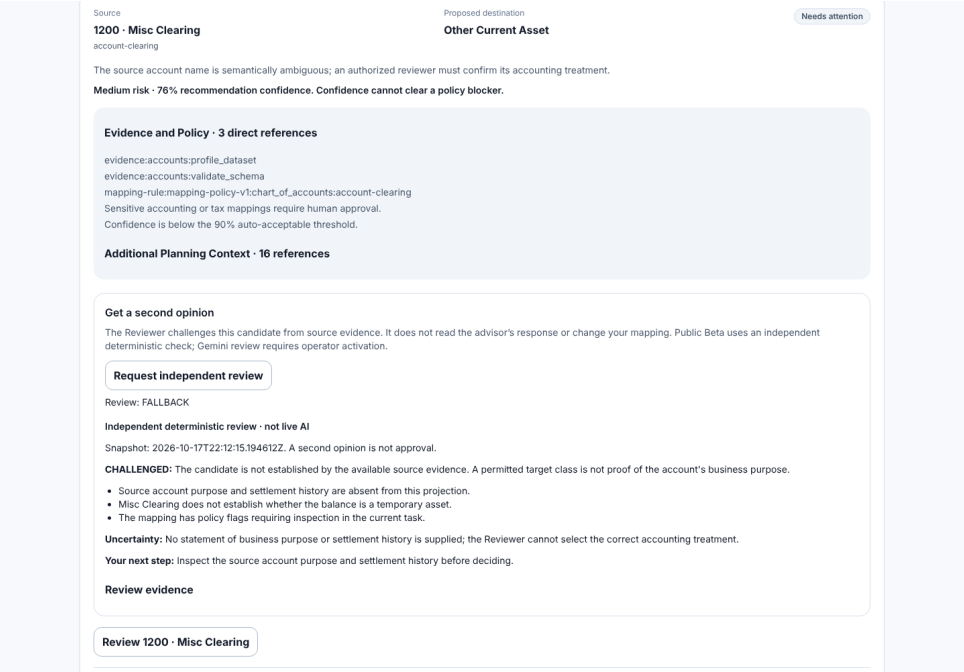

Trust: checkpoints, idempotency, controlled recovery, exact reconciliation, sensitive approval and verified synthetic FPU.

Process flow diagram or Use-case diagram

	Understand	Prepare	Move	Verify	Start
Accountant approves each consequential step	Choose a business; start the readiness check	Review 12 mappings; approve the plan separately	Approve the remedy for a paused batch	Approve currency, tax and role settings	Approve the first invoice
Deterministic agents run the workflow; rules verify	Discover data; assess readiness	Version the plan; propose mappings	Move in checkpoints; stop on a duplicate	Reconcile 17 checks; apply settings	Post and verify the invoice
Advisory AI Advisor + Reviewer; gated off in the public Beta	No advice needed	Explain a mapping; Reviewer challenges 1200	Explain the exception and options	Explain a setting	Explain prerequisites
System of record Cloud SQL, owner-scoped	Owner-scoped migration session	Plan versions and decisions	Checkpoints; work never replayed	Validation results and settings	Verified invoice: USD 107.25

Approves · Executes and verifies · Advises only: read-only evidence, no write path, validated or replaced by a labelled fallback

Wireframes/Mock diagrams of the proposed solution (optional)

Implemented decision UI

Inspect account 1200.

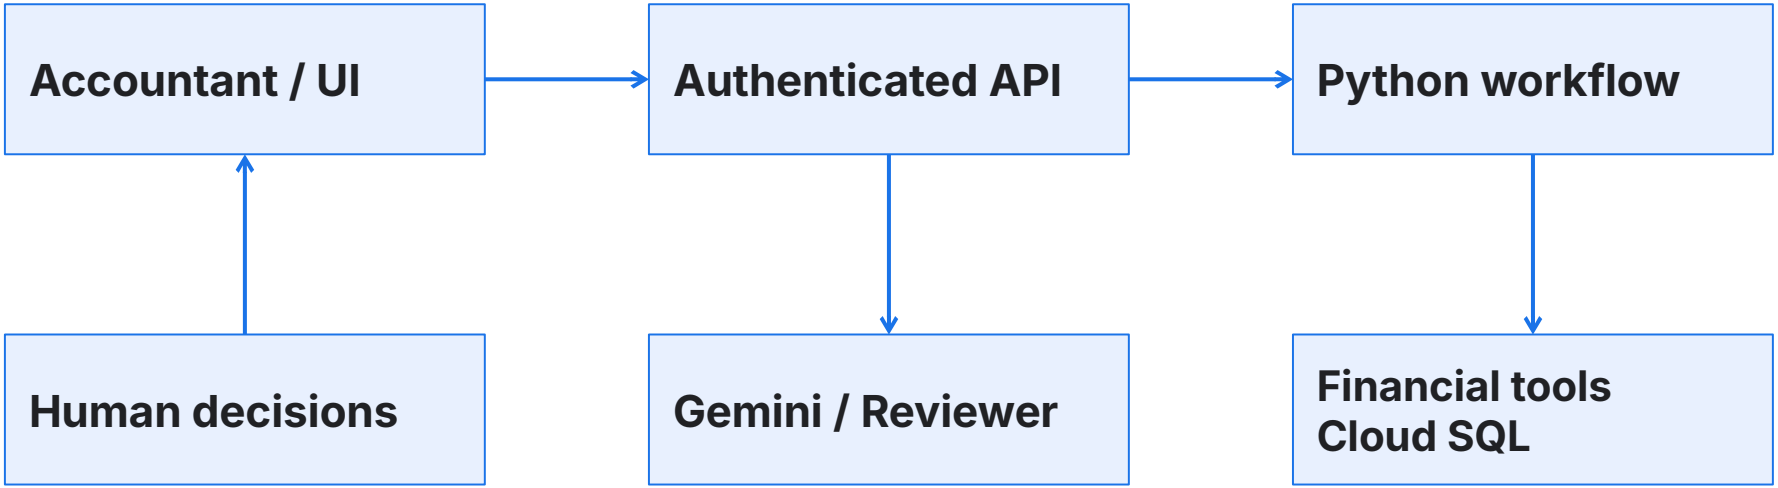

Request independent review.

See uncertainty and evidence.

Approve, reject or modify.

Authentic local candidate screenshot, not a simulated mockup or deployed-candidate claim.

Architecture diagram of the proposed solution

Advice returns to the accountant; only deterministic operations change financial state.
13 roles, 7 ADK definitions, 2 gated model pathways, 0 autonomous agents.

Technologies to be used in the solution

Application: Next.js / TypeScript UI and FastAPI / Python services, with Firebase Hosting, Cloud Run, Firebase Authentication and Cloud SQL boundaries.

AI source: bounded Vertex AI / Gemini and Google ADK advisory integration. Public API remains deterministic-only; a bounded live run on gemini-3.5-flash-lite passed 14/14.

Operational source: owner-scoped Firestore reservations and outcome readback. Dormant Singapore database, deny-client rules and index provisioned; both control flags false.

Supporting adapters: private Cloud Storage, allowlisted Secret Manager, sanitized Logging. Source presence does not prove active service use.

Estimated implementation cost (optional)

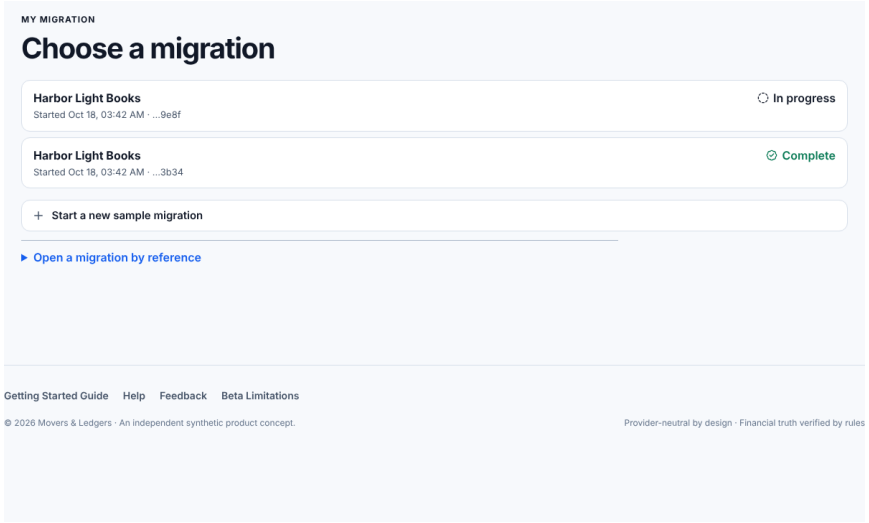

No measured implementation spend, current workload quote or commercial price is asserted.

Cost model: Cloud Run compute/time, SQL capacity/storage/backups, model input/output tokens, Firestore operations, storage/egress and logs.

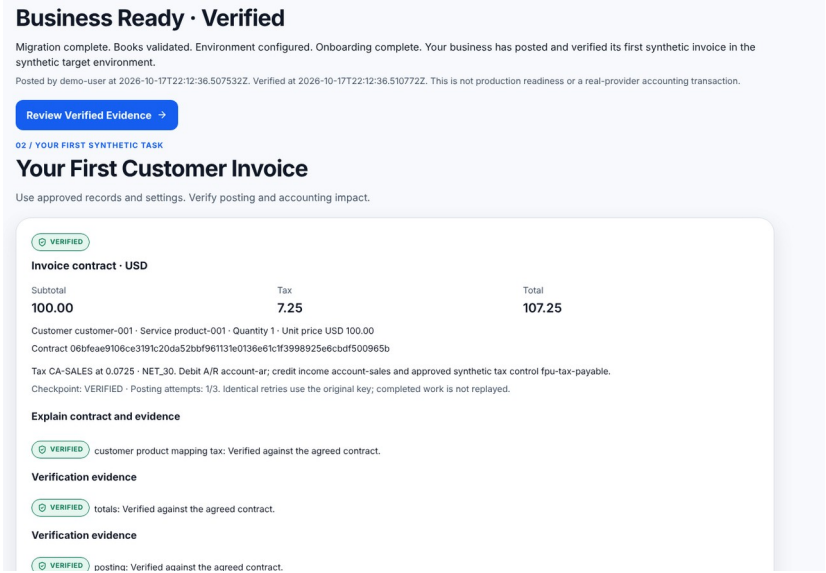

Human effort includes financial review, support and recovery. Publish region, pricing date, workload assumptions and observed spend before a numerical estimate.

Controls bound exposure through owner quotas, conservative durable budget reservations and a kill switch. Resource free-tier metadata is not a guarantee of zero cost.

Snapshots of the prototype

Owner-scoped migration picker

Approved invoice and verified FPU

Local captures at fa13e9e on the real local API. Synthetic invoice USD 107.25 incl. tax.

Prototype Performance report/Benchmarking

663 backend passed

0 failed, 86 skipped; source 09a8d01

696 frontend passed

52 files; lint/types/build passed

Backend with all optional Google libraries installed: 663 passed, 0 failed. Without them, 26 failures, all missing-library only.

End-to-end UI journey 21/21 checks on the real local API, recorded as a 3:43.7 video. Offline Advisor/Reviewer evaluation 23/23 (boundaries, not model accuracy).

Live Gemini: one bounded Advisor + Reviewer run passed 14/14 (4 model calls). Release: candidates smoke-tested 13/13; npm and pip audits 0 known vulnerabilities.

Additional Details/Future Development (if any)

Done: bounded live Gemini test (14/14), images built and scanned, no-traffic candidates deployed and smoke-tested (13/13).

Next, release-gated: database backup, API-first promotion with recorded rollback revisions, then real Google sign-in and two-account isolation.

Hosted uploads require their independent parser-isolation, malware, identity/tenant, retention, abuse and negative-test gate. Local validation stays available.

Later: supported provider adapters, reviewed real-data handling, delegated roles and observed customer outcomes. No current real-provider migration is offered.

Provide links to your:

GitHub Public Repository

https://github.com/JEMathew/movers-and-ledgers

Demo Video Link

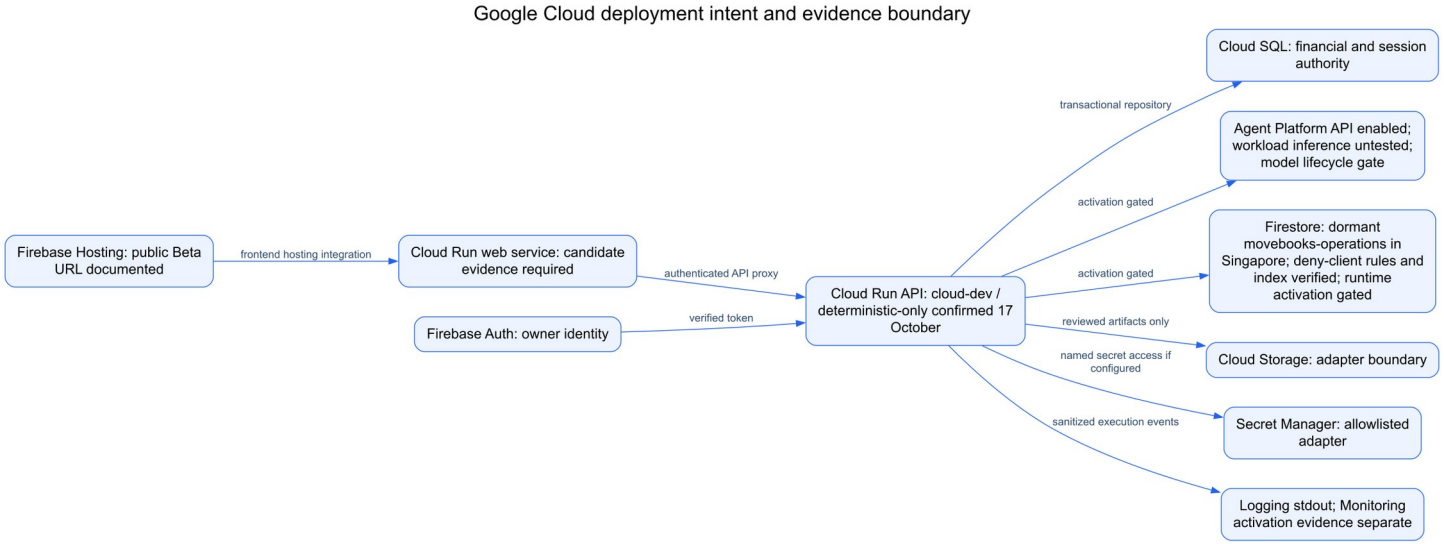

Public URL pending upload. Local file: movebooks-demo.mp4 (3:43.7, H.264), recorded on the real local API.

Final Product Link

https://movebooks-si.web.app

Reachable public Beta. This does not prove the submission candidate is deployed.

Google Cloud implementation and release gates

Dormant operations resources are provisioned. Both control flags remain false. Live inference is verified only in a bounded test harness; activation needs separate authorization.
