MoveBooks AI

Move your books. Keep your confidence.

Movers & Ledgers

Accounting migration, from understanding to verified first productive use

Team and delivery scope

Movers & Ledgers develops MoveBooks AI as an independent product concept.

The submission candidate combines product, engineering, financial systems, AI evaluation and release responsibilities.

Team names, roles and contact details await the submission owner.

The accounting handover problem

A completed import does not show whether the books are ready for work.

Accountants need to understand unsupported records, ambiguous mappings and financial differences.

The proposed outcome is an informed, approved and verified first productive task.

BFSI: Intelligent Risk, Fraud & Financial Experiences. Fit: migration risk, complex process automation and informed financial decisions.

The product idea

One governed journey

Understand and prepare with evidence before making consequential decisions.

Move supported synthetic information with checkpoints and safe recovery.

Verify financial correctness, configure the environment and complete an approved first invoice.

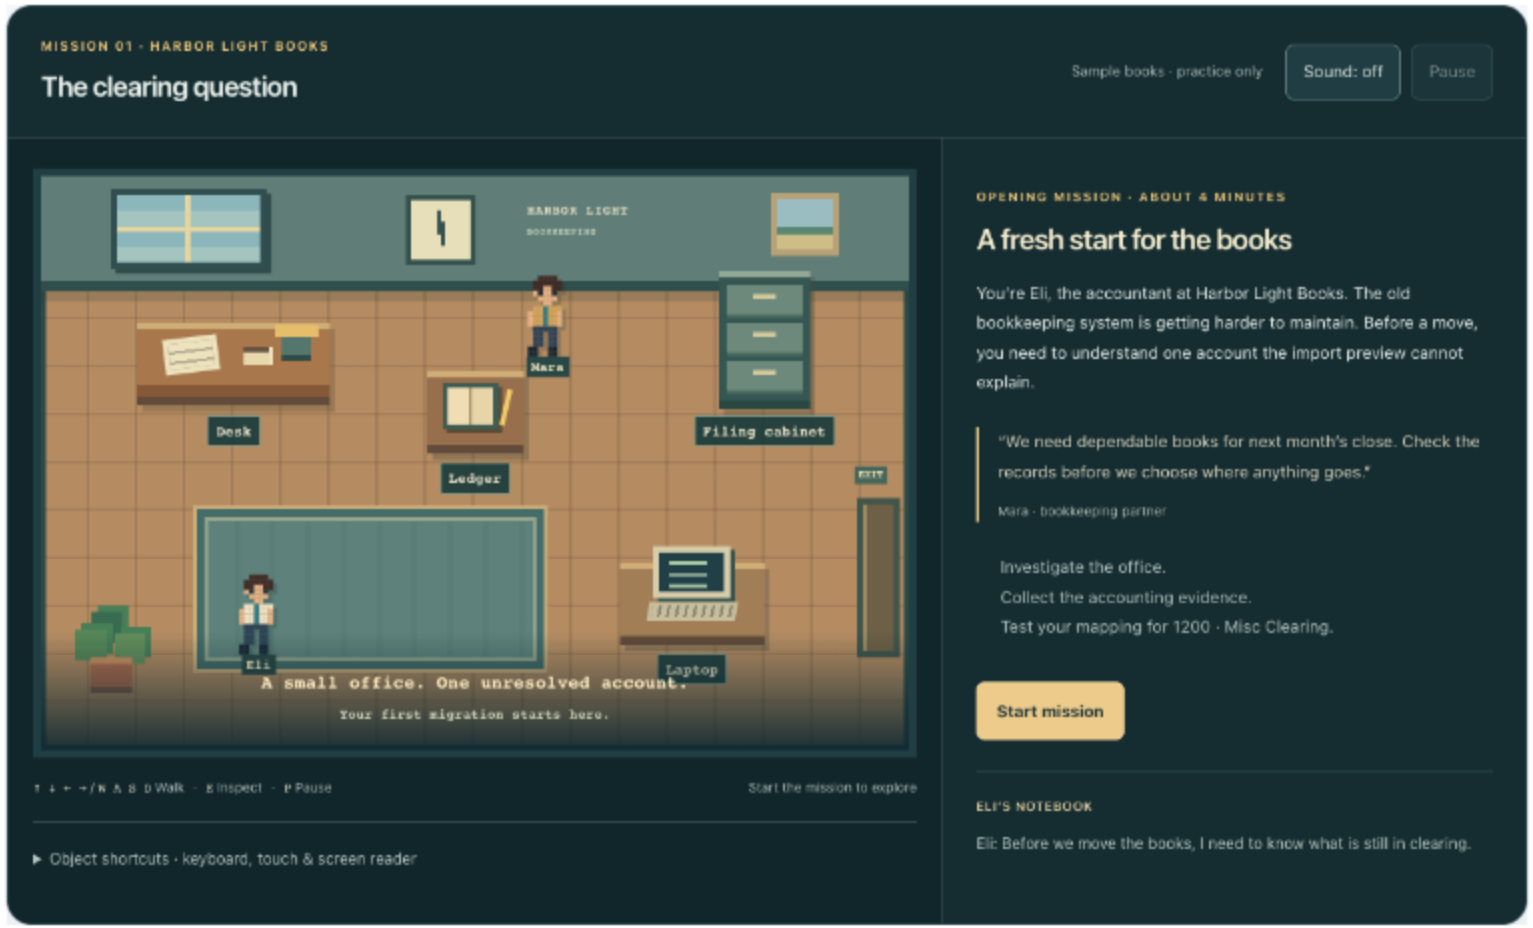

Differentiation

Continuity from learning and readiness to financial verification and productive adoption.

A human accountant controls consequential choices. Gemini explains. A separate Reviewer challenges.

Deterministic tools establish financial truth, while internal Judges evaluate quality outside the execution path.

Three entry experiences

Authentic local candidate capture. Play acceptance: 14 browser checks passed.

Play

Explore an office and solve an evidence puzzle.

Explore Demo

Rehearse Harbor Light Books through verified FPU.

Try Your Data

Validate permitted test packages locally. Hosted uploads stay gated.

Migration process

01

Understand

Discover and assess

02

Prepare

Plan, map and approve

03

Move

Migrate and resolve

04

Verify

Reconcile and configure

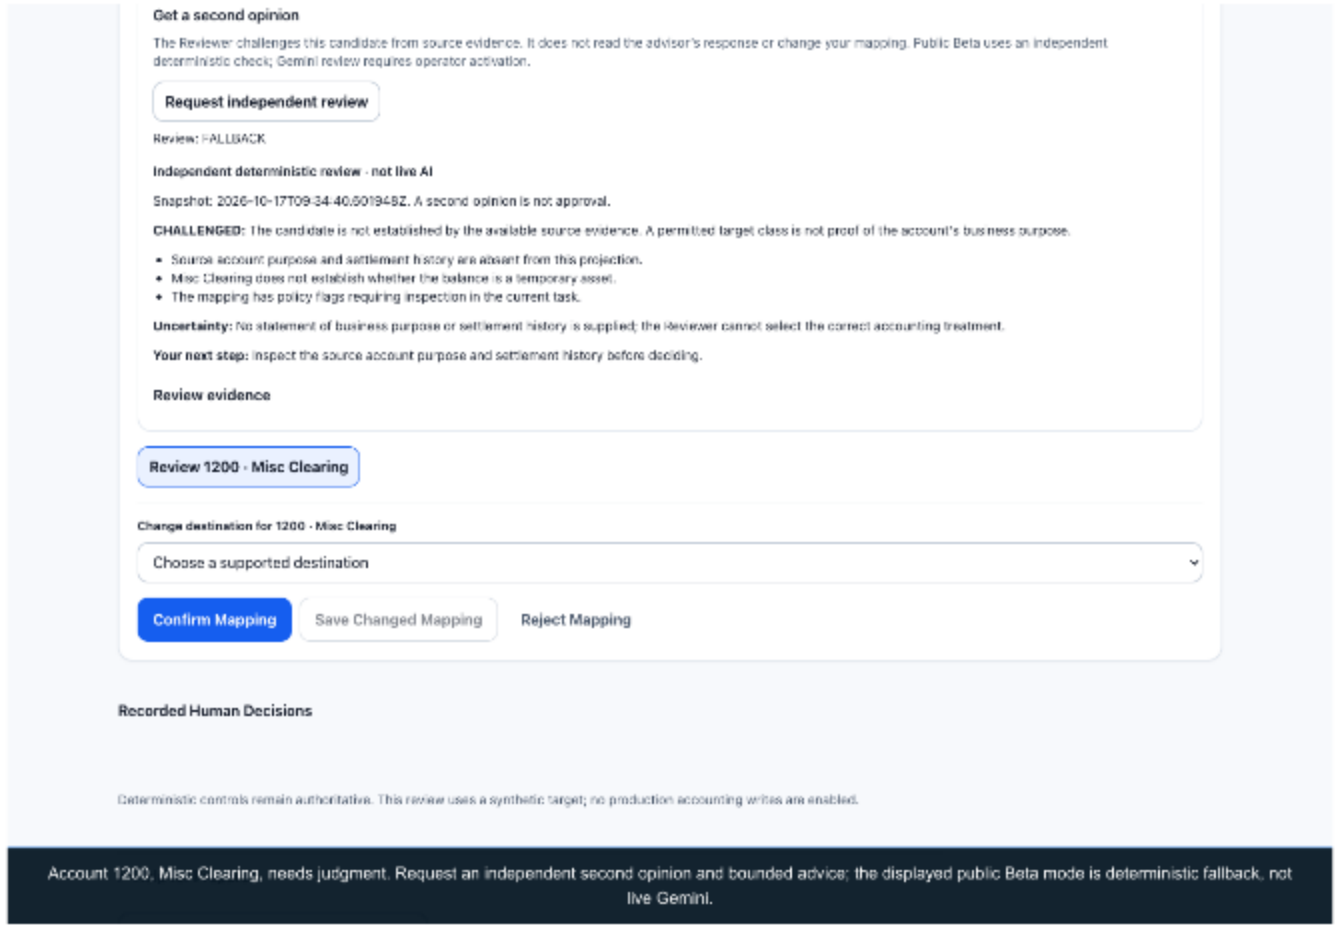

05

Start

Onboard and verified FPU

Progress follows evidence and valid state transitions. Financial discrepancies stop the journey.

Decision experience and wireframes

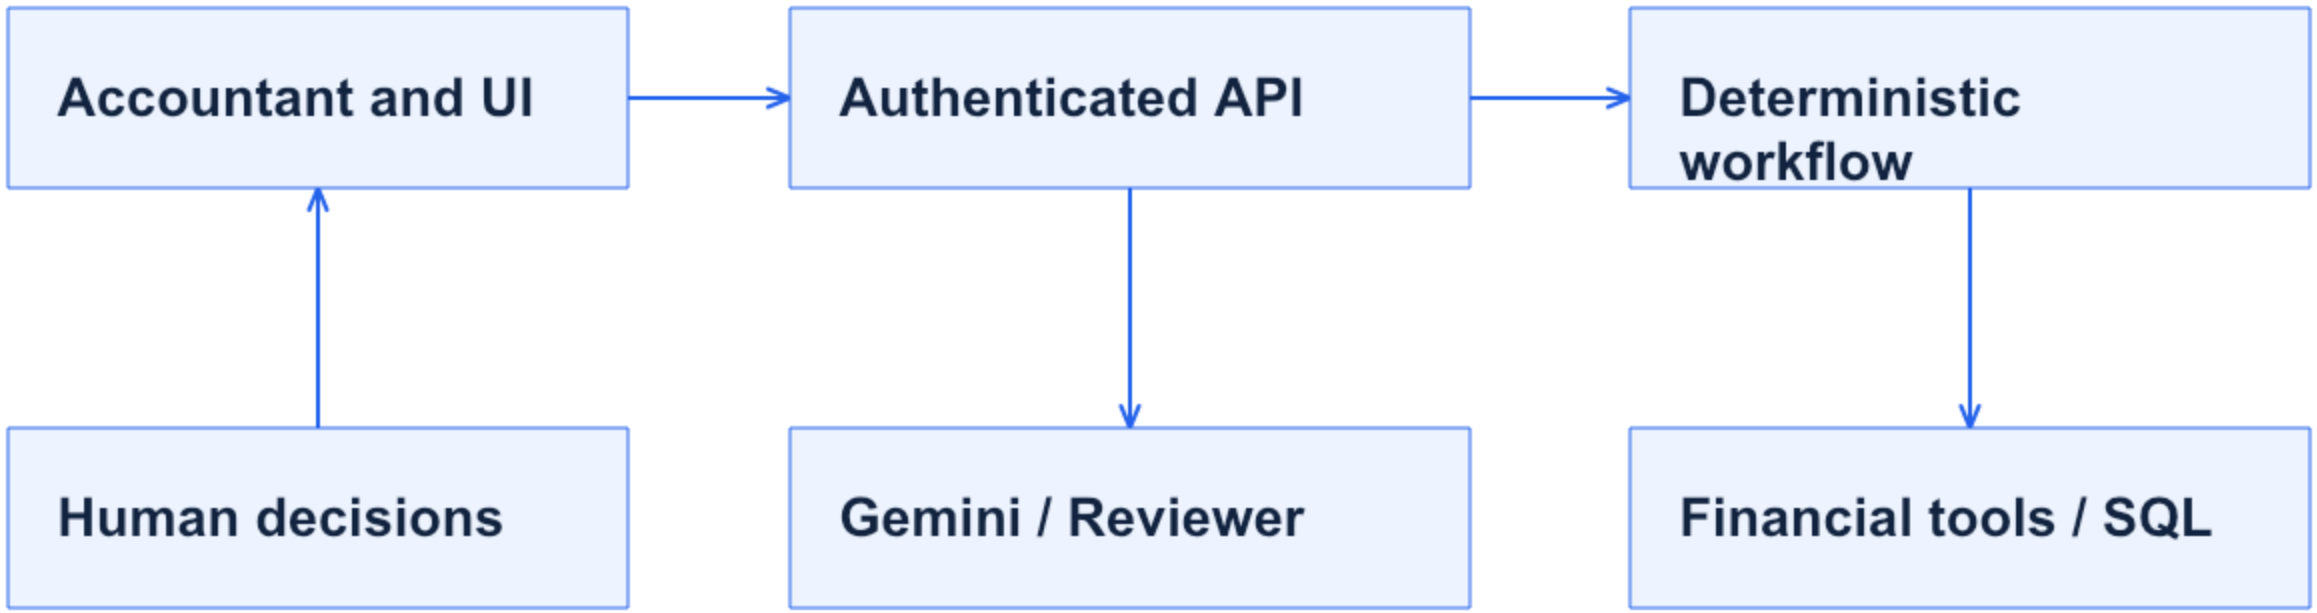

Evidence first

What is happening?
Why is it happening?
What happens next?

Accepted local UI: independent challenge, explicit uncertainty and next action.

Technical architecture

Advisory output returns to the accountant. Only authorized deterministic operations change financial state.

Google Cloud technologies

Firebase Hosting, Firebase Authentication and Cloud Run form the application and identity boundaries.

Cloud SQL / PostgreSQL retains financial and transactional authority. Cloud Storage and Secret Manager have scoped adapter boundaries.

Vertex AI / Gemini and Google ADK supply bounded advisory integration. Firestore reservations, outcomes and owner-scoped activity readback are implemented; live activation remains gated.

Last known public mode: deterministic-only. Vertex API enablement alone does not prove inference access.

Implementation cost model

A bounded cost model precedes activation

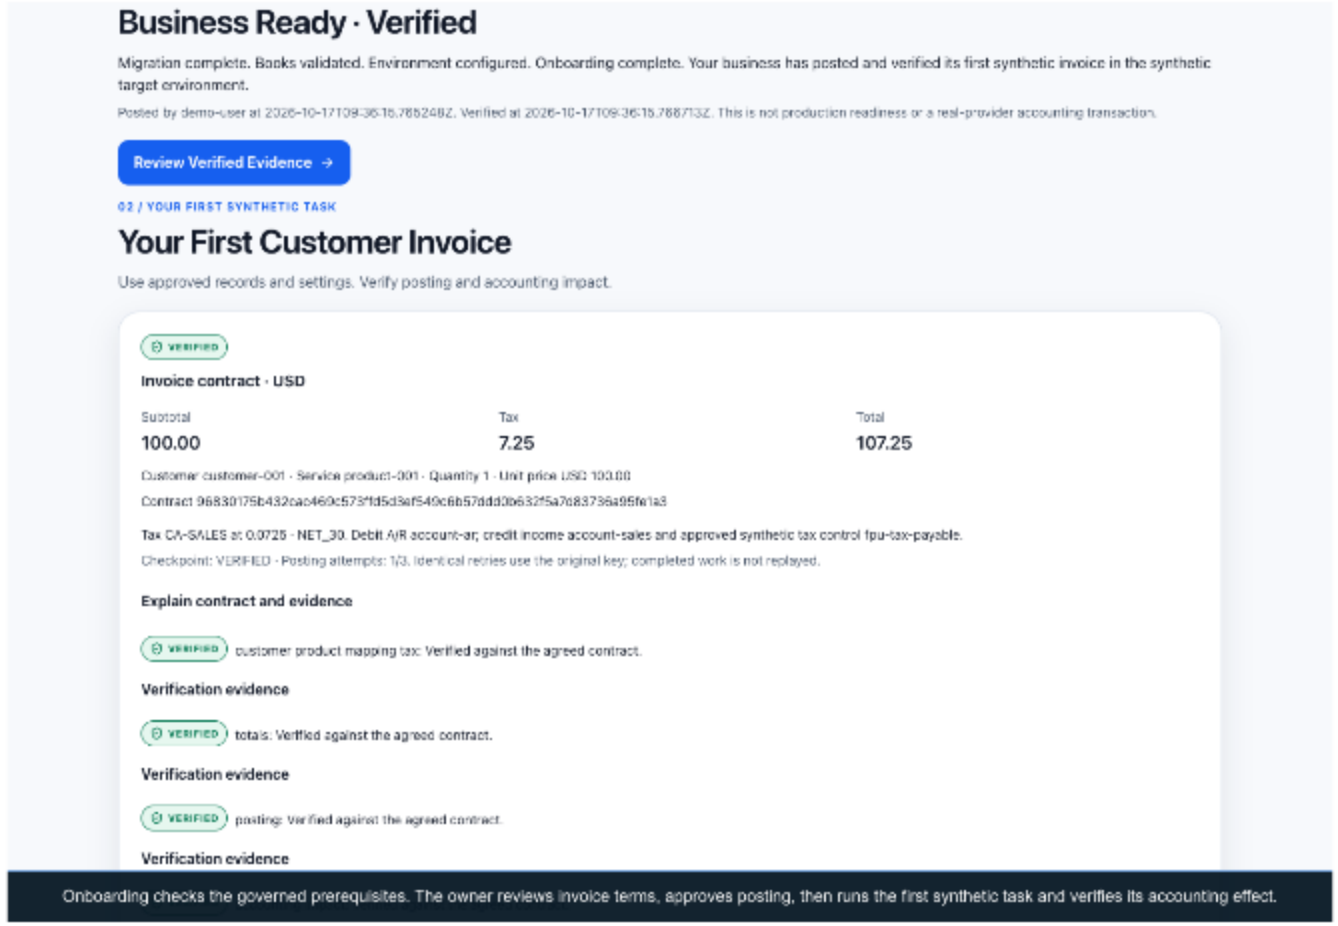

Compute and database: runtime seconds, memory, SQL capacity, storage and backups.

AI and operations: model tokens, Firestore operations, logs, storage and egress.

Service effort: support, financial review and recovery. Owner quotas, durable budgets and a kill switch bound exposure.

Estimate status: unpriced. Publish currency, region, pricing date, workload assumptions and observed spend before asserting cost.

Financial verification and first productive use

Verified outcome

Required controls pass.

The owner approves a synthetic invoice.

A deterministic receipt verifies its effect.

Benchmarking and validation

Backend tests

584 passed

58 skipped

Frontend tests

674 passed

51 test files

Checks cover owner and approval boundaries, state transitions, recovery, reconciliation, UI behavior and synthetic FPU.

Local candidate: 17/17 full-journey browser checks; 14/14 Play checks. Lint, types and build passed. Live-model quality and customer impact unmeasured.

Future roadmap

Now: accept the synthetic journey, Play mission, local intake, mapping review, offline evaluation and submission evidence.

Next, gated: verify live Gemini and Firestore operations; complete independent hosted-upload safety and operating controls.

Later: reviewed provider adapters, real-data handling, delegated roles and observed customer outcomes.

Submission links and evidence
